

Our rain barrels are the ultimate in recycling. Not only are you collecting rain water to reduce using expensive, treated drinking water on your lawn and garden, but you are also helping recycle barrels that were originally brought into this country filled with various food products. It is unsafe to use recycled barrels that once held chemicals or other non-food products to collect water. Ours are food grade barrels, which are safe for use as rain barrels. These barrels have traveled thousands of miles and have small scuffs and scratches on them, making each one unique.

Water Rates are always on the increase

As cities continue to raise water and sewer rates, saving rainwater saves money and helps the environment. A rain barrel can save most homeowners about 1,300 gallons of water during the peak summer months.

Average Rainfall for the Quad City area is 39.3 inches per year.

One inch of rain falling on an average size house roof of 1,000 square feet produces over 600 gallons of rainwater.

Anatomy of a Rain Barrel

Various diverters are available to get the water from the downspout to the barrel

Child-proof screened lid also keeps out mosquitos, animals, etc.

Over flow valve diverts water away from the barrel when full or as another option to hook up an additional barrel

Recycled food grade Poly Ethylene barrels

Bottom plug to link 2 or more barrels together

Threaded spigot to hook up a garden hose or place your water can under

Elevate your barrel to get maximum gravity flow

Plastic fittings are used because brass and steel do not interface well with plastic.

DON'T SETTLE FOR ONE STYLE OR COLOR

Available in Blue, Terra-Cotta, Gray and Black

Other colors may be available depending on current shipments.

Contact a representative from Quad City Rain Barrels or visit our website for a current listing.

Water Use

Not just for plants or gardens any more. Rainwater can be used for a large variety of chores around the house such as:

- Window cleaning
- Fill your bird bath
- Wash your vehicles, bikes, lawn equipment
- BE CREATIVE!!
- Small construction projects
- Clean work boots and tools

Tumbling Composters

Interior showing break up bars and oxygen tube

The composter is about 4 foot tall and only requires a 3 foot by 4 foot area.

What is great about a tumbler is that you turn the tumbler, not the compost. Which in turn shifts the composting ingredients inside around enough to aerate them making finished compost in as little as 2 weeks.
